CLAIM LISTING

(Currently Amended) A medical device comprising:

 a stud configured to project percutaneously outward through a patient's skin

layers;

said stud defining an outer end and having a longitudinal peripheral surface extending inwardly from said outer end;

said peripheral surface having a longitudinal porous layer thereon for promoting soft tissue ingrowth;

a shoulder surface oriented substantially perpendicular to said stud peripheral surface and located inwardly from said stud outer end and from said longitudinal porous layer; and wherein

said shoulder surface has a lateral porous layer thereon oriented substantially perpendicular to said longitudinal porous layer for promoting soft tissue ingrowth; and wherein

at least one of said porous layers is characterized by a pore size within the range of 50 to 200 microns with a porosity of between 60 to 95%.

- 2. (Canceled) The medical device of claim 1 wherein at least one of said porous layers is characterized by a pore size within the range of 50 to 200 microns with a porosity of between 60 to 95%.
- (Original) The medical device of claim 1 wherein at least one of said porous layers comprises a mesh of fibers.
- 4. (Original) The medical device of claim 1 wherein at least one of said porous layers comprises a mass of sintered material.
- 5. (Original) The medical device of claim 3 wherein said fibers are of metal material from within a group comprised of titanium, nitinol, silver, and stainless steel.

6 .	(Original) The medical device of claim 3 wherein said fibers are of polymeric
material.	

- 7. (Original) The medical device of claim 4 wherein said mass is formed of metal material from within a group comprised of titanium, nitinol, silver, and stainless steel.
- 8. (Original) The medical device of claim 4 wherein said mass is formed of polymeric material.
- (Original) The medical device of claim 1 wherein said stud carries means for promoting healing.
- 10. (Withdrawn) The medical device of claim 1 wherein said stud carries a sound generator and is configured to percutaneously project into a patient's ear canal.
- 11. (Withdrawn) The medical device of claim 1 wherein said stud comprises a portion of an implanted catheter providing access to an interior body site.
- 12. (Withdrawn) The medical device of claim 1 wherein said stud includes a sensor coupled to an interior body site.
- 13. (Original) The medical device of claim 1 further including a transitional layer mounted on said stud between said stud outer end and said longitudinal layer.
- 14. (Original) The medical device of claim 1 further including a cap configured for mounting on said stud outer end.
- 15. (Original) The medical device of claim 1 wherein said porous layers are formed of biocompatible material.

"

16. (Currently Amended) A method of configuring an implantable medical device with a portion adapted to project percutaneously comprising the steps of:

providing a longitudinally projecting stud on said device having an outer end and a peripheral surface extending longitudinally inward from said outer end;

providing a laterally projecting shoulder surface on said device located inwardly from and oriented substantially perpendicular to said stud peripheral surface; and

forming a lateral porous layer on said shoulder surface and a longitudinal porous layer on said peripheral surface wherein said porous layers each have a pore size within a range of 50 to 200 microns and a porosity of between 60 to 95% for promoting soft tissue ingrowth and establishing an infection resistant barrier.

17. (Canceled) The method of claim 16 wherein said step of forming a porous layer comprises forming the layer with a pore size within a range of 50 to 200 microns with a porosity of between 60 to 95%.

- 18. (Original) The method of claim 16 wherein said step of forming a porous layer comprises forming at least a portion of said layer with a fiber mesh.
- 19. (Original) The method of claim 16 wherein said step of forming a porous layer comprises forming at least a portion of said layer with a mass of sintered material.
- 20. (Original) The method of claim 16 wherein said porous layer is formed at least in part of metal material from within a group comprised of titanium, nitinol, silver, and stainless steel.
- 21. (Original) The method of claim 16 wherein said porous layer is formed at least in part of polymeric material.
